Nuke Em®

Quick Reference Guide

When the instructions for use on the Nuke em® label were written, much care was taken to make sure no harm would come to fragile, delicate or weak plants. More information is now available for more robust plants.

Because Nuke em® is a contact killer, it is very important that every mite and their eggs come into contact with Nuke em®. Even in the best conditions with careful applications it is very hard get complete coverage on the first spray. Growers are reporting to us that they have had good luck with these **MODIFIED** applications.

Remember to:

1. Wash all other insecticides and fungicides off of leaves with clear or Z⁷ treated water before applying Nuke em®.
2. Flush the growing medium until the water coming from the pot matches the PPM/EC of your water supply. Only a PPM/TDS/EC meter can tell you this. If you don't have access to a hand held EC/PPM meter, flush your plants very well and wait one hour before applying Nuke em®. The use of Z⁷ in the flush water, and continued use afterward, would of great benefit to the plants. Read Redman's Rules for Vigorous Root Zone Growth (flyingskull.net FAQ's).
3. It has been suggested that using Z⁷ treated water to make up the diluted Nuke em® has helped.

Disclaimer: Certified organic growers should take note that Z⁷ has not received its OMRI registration as of September 22nd, 2013. Flying Skull is not suggesting that Z⁷ is an insecticide or fungicide nor in any way helps to kill insects or fungus.
